

Tableau Prep and TabPy Integration Report

This report demonstrates the integration of Tableau Prep with Python using TabPy. The task involved loading an employee CSV dataset, applying a Python script through a Script Step, filtering IT department employees, calculating the average salary, and identifying the oldest employee.

Steps Performed

Step	Description
1	Connected Tableau Prep to employee_tableau_prep_python_sample.csv
2	Started TabPy server on localhost:9004
3	Added a Script Step in Tableau Prep
4	Connected the Script Step to TabPy
5	Executed a Python script to process employee data
6	Filtered employees from the IT department
7	Calculated the average salary of all employees
8	Identified the oldest employee and department
9	Generated the transformed output and exported it as CSV

Final Output

Employee ID	Employee Name	Department	Age	Salary	Average_Salary_All_Employees	Oldest_Employee Name	Oldest_Employee Department
E001	Anna Weber	IT	29	52,000	57,100	Helga Braun	HR
E003	Sara Hoffmann	IT	35	58,000	57,100	Helga Braun	HR
E006	Omar Yilmaz	IT	52	72,000	57,100	Helga Braun	HR
E009	Maya Becker	IT	44	69,000	57,100	Helga Braun	HR
E012	Tim Schneider	IT	25	48,000	57,100	Helga Braun	HR

The integration between Tableau Prep and TabPy was successfully established. The Python script executed correctly and produced the required transformed dataset. The final output included only IT employees along with calculated salary and oldest employee details.
